Personal Website

SUMMARY

Full-stack software engineer with 3 years of experience shipping production software. Made Pick Ma Job, a job-seeker's website made with FastAPI, PostgreSQL, React and TypeScript that scores job postings against each user's profile with the Claude API and has multiple active users. Before that, two years at ZAUBAR split evenly between web work (Vue.js and TypeScript frontends, APIs, Directus CMS data modelling) and Unity XR, as sole developer on 4 of 10 shipped applications, owning each through CI/CD release. Also built an authoritative multiplayer game server from scratch in Rust which was used in Unity multiplayer game and made generic to be used in any game

SKILLS AND TECHNOLOGIES

Languages: Python, TypeScript/JavaScript, SQL, Rust, C#, C++, Swift

Backend: FastAPI, PostgreSQL, asyncio, Pydantic, Tokio, Protocol Buffers, WebSocket, Directus CMS

Frontend: React, Vue.js, Vite, Tailwind CSS, TanStack Query, Zod, three.js

LLM applications: Anthropic Claude API: multi-pass evaluation pipelines, JSON output parsing, rate-limit handling with retry and backoff, token and latency logging

Testing: pytest, Vitest, MSW, Playwright

CI/CD: GitHub Actions, Jenkins, Firebase App Distribution, Git, Linux, nginx, systemd

XR, 3D & graphics: Unity, OpenXR, XR Interaction Toolkit, AR Foundation, ARKit, ARCore, Photon SDK, OpenGL, GLSL

Currently expanding / Worked with: Docker, Kubernetes, Terraform, AWS, Apache Kafka, Redis, GraphQL, Spring Boot

EXPERIENCE

Software Engineer, *Freelance*

08/2025 – Present
Remote, Germany

Pick Ma Job (pickmajob.cc , github.com/WallerTheDeveloper/pick-ma-job): multi-user SaaS for AI-driven job evaluation, in production with multiple active users. Built and operated solo.

- Built the backend in Python and FastAPI on PostgreSQL with asyncpg, layered into routes, services and repositories: 44 REST endpoints, 19 SQL migrations, keyset pagination and user-scoped queries.
- Implemented two-pass evaluation on the Claude API: a 16-token scoring pass on every posting, then a full structured analysis only above a score threshold, run as background asyncio tasks with a concurrency limit and retry with backoff.
- Implemented passwordless magic-link authentication with hashed tokens, HMAC-based CSRF protection and rate limiting.
- Built the frontend in React 19, strict TypeScript, Vite and Tailwind CSS with TanStack Query and Zod: cursor-paginated results, filters, bulk actions and job lists.
- Wrote pytest and Vitest test suites (about 550 backend and 135 frontend tests) and deployed on an Ubuntu server behind nginx with systemd and a scripted deploy.

Other work

- **Authoritative multiplayer game server** : Rust, Tokio, Protocol Buffers over UDP and WebSocket, 20 Hz tick simulation, 60 unit tests.
- **Personal website** : TypeScript and three.js, Vitest and Playwright tests, GitHub Actions deployment to GitHub Pages.
- **Paper.io 2 clone client** : Unity (URP), client-side prediction with server reconciliation, procedural mesh rendering, WebGL build.
- **Solar System Simulation** : rendering engine in C++17 and OpenGL 3.3 with custom shaders, camera and scene management.
- **VR Tower Defense** : Unity, OpenXR and XR Interaction Toolkit on Meta Quest 3, with hand tracking, passthrough and state-machine tower AI.

AR & Web Developer, *ZAUBAR* 08/2023 – 07/2025
Berlin, Germany

- Split the role evenly between web and Unity work; built the web frontends in Vue.js, TypeScript and Tailwind CSS.
- Built APIs, designed and implemented the Directus CMS data schemas, and set up and administered Directus so non-engineers could manage app content without developers.
- Wrote and hosted the server for a multiplayer project, and engineered a Unity-to-web protocol bridge so native AR scenes could exchange data with the web layer.
- Shipped 10 Unity XR/AR applications and was sole developer on 4, owning each from build through CI/CD release to distribution.
- Unity highlights: rebuilt the Tunnel 57 VR experience on OpenXR for Meta Quest with SenseGlove Nova 2 and Actronika Skinetic haptics; built the Euro 2024 multiplayer AR demo as the first engineer to integrate the in-house multiplayer SDK; wrote a Swift QR-scanning plugin that kept App Clips and Instant Apps under 15 MB; profiled and optimised 3 production applications.

EDUCATION

Bachelor of Computer Science, *Lublin University of Technology* 10/2019 – 02/2023
Lublin, Poland

Thesis: Implementation of a 4X Strategy Game with Unity Engine (**Parallax**)
