SUMMARY

Software engineer with 2 years of professional experience building, shipping, and supporting production mobile/AR apps end-to-end. Prefer taking responsibility and owning features through the full release process: creating REST API design, relational data modeling, and CI/CD automation. Independent backend work include a production FastAPI & async PostgreSQL SaaS (live, multiple active users) and an authoritative multiplayer game server built from scratch in Rust. Core languages are C#, C++, TypeScript, Python, and Rust.

SKILLS AND TECHNOLOGIES

Languages: C#, C++, Rust, Python, TypeScript/JavaScript, Swift

Backend: FastAPI, REST APIs, PostgreSQL, Directus CMS

Frontend: React, Vue.js, Vite, Tailwind CSS

Graphics / XR: Unity Engine, AR Foundation, ARKit, ARCore, OpenXR, OpenGL, GLSL

CI/CD & Tooling: Jenkins, GitHub Actions, Firebase App Distribution, Git

Currently expanding / Worked with: Docker, Kubernetes, Terraform, AWS, Apache Kafka, Redis, GraphQL, Spring Boot

EXPERIENCE

Software Engineer, *Independent Projects*

08/2025 – Present
Remote, Germany

- Designed and built a full-stack SaaS for AI-driven job evaluation, pairing a FastAPI and PostgreSQL backend (async I/O via asyncpg) with a React and Vite frontend and the Claude API; running in production with multiple active users
- Built an authoritative multiplayer game server from scratch in Rust, designing a hybrid REST and message-based protocol that keeps client state synchronised in real time
- Engineered a physics-based 3D rendering engine in C++17 and OpenGL 3.3, writing custom shaders and camera and scene-management systems to drive a real-time solar-system simulation
- Built a VR game in Unity with OpenXR and the XR Interaction Toolkit, designing state-machine-driven tower AI to control enemy behaviour

AR & Web Developer, *ZAUBAR*

08/2023 – 07/2025
Berlin, Germany

- Shipped 10 augmented reality applications over two years and was sole developer on 4, owning each from build through the full CI/CD release cycle to distribution
- Rebuilt the Tunnel 57 VR experience on OpenXR and the XR Interaction Toolkit, integrating SenseGlove Nova 2 and Actronika Skinetic hardware to add physical haptic feedback
- Built the Euro 2024 multiplayer AR demo and was the first engineer on the team to integrate its in-house multiplayer SDK, validating the SDK for later projects
- Wrote a Swift QR-scanning plugin and trimmed the zxing library so App Clips and Instant Apps stayed under the 15 MB platform size limit
- Profiled and optimised 3 production applications with the Unity Profiler to improve runtime performance
- Built the web frontends in Vue.js, TypeScript, and Tailwind CSS and engineered a Unity-to-web protocol bridge so native AR scenes could exchange data with the web layer
- Set up and administered a Directus CMS and its API, enabling non-engineers to manage app content without developer involvement

EDUCATION

Bachelor of Computer Science, *Lublin University of Technology*
Thesis: Implementation of a 4X Strategy Game with Unity Engine

10/2019 – 02/2023
Lublin, Poland

LANGUAGES

English — Proficient

Ukrainian — Native/Bilingual

Russian — Native/Bilingual

Polish — Fluent

German — Basic

Projects

Pick Ma Job [↗](https://github.com/WallerTheDeveloper/pick-ma-job), <https://github.com/WallerTheDeveloper/pick-ma-job>

Pick Ma Job is a multi-user SaaS platform that scrapes job postings from Upwork and LinkedIn, evaluates every posting against your profile using Anthropic's Claude API, and presents only the most relevant opportunities in a clean, modern React UI

Paper.io 2 Clone (Multiplayer Game) [↗](https://github.com/WallerTheDeveloper/paperio-clone), <https://github.com/WallerTheDeveloper/paperio-clone>

A fully authoritative multiplayer territory-capture game inspired by Voodoo's Paper.io [↗](#) 2. Built with a custom Rust server and Unity 3D client (URP) featuring real-time state sync, procedural trail rendering, flood-fill territory claiming, and client-side prediction

Solar System Simulation [↗](https://github.com/WallerTheDeveloper/solar-system-opengl), <https://github.com/WallerTheDeveloper/solar-system-opengl>

A real-time 3D visualization of our solar system, built from scratch using C++ and OpenGL. This project showcases accurate orbital mechanics, realistic planet rendering, and an interactive camera system that lets you explore space at your own pace

VR Tower Defense Game [↗](https://github.com/WallerTheDeveloper/vr-tower-defense), <https://github.com/WallerTheDeveloper/vr-tower-defense>

Click here for demo [↗](#) A Virtual Reality tower defense game built with Unity, featuring immersive spatial gameplay where players defend their headquarters using strategic tower placement. Project uses Passthrough feature. Players must defend their headquarters from enemy attacks by strategically placing and managing different types of towers. The VR implementation allows for intuitive hand-based interactions and immersive spatial awareness that traditional tower defense games can't provide

Parallax [↗](https://github.com/WallerTheDeveloper/Parallax), <https://github.com/WallerTheDeveloper/Parallax>

4X RTS strategy game made in Unity. The core gameplay is exploring new territories, expanding already acquired area, exploiting resources and exterminating enemies on the map
